DIURNAL RHYTHM OF THE ELECTROENCEPHALOGRAPH (EEG) SHIFTS A PERIOD OF 72 HOURS SLEEPINESS

Article by A. A. Korshkov, Moscow, *Russkoe Psichicheskoye Nauchnoye Izvestiye*, Russian, Vol 6, No 1, pp 38-62, 1972, submitted for publication 19 July 1971

ENC 122 222 7722 22-6122 221 7-066

5 APR 2 1972  
191 (100) 1972

Abstract: The author studied EEG diurnal rhythms during a period of 72 hours sleeplessness to which ten healthy individuals were subjected. These and further studies have shown that test subjects with a stable rhythm of cerebral bioelectric activity can adapt less well and those with an unstable rhythm of activity can adapt better to altered work and rest schedules.

Numerous studies have been devoted to an investigation of human cerebral bioelectric activity under ground conditions when there are ordinary diurnal schedules (V. A. Adamovich, P. I. Gulyaev; M. N. Livshov; A. A. Gankin; H. A. Gavrilova; H. B. Danilova, V. V. Zolotarev, and others). According to data published by some authors (V. B. Bakin, et al.; A. A. Korshkov; A. H. Litov, 1966; V. I. Myasnikov, Davids), the EEG of healthy individuals subjected to prolonged isolation is characterized with a change in the  $\alpha$ -rhythm with a tendency to its synchronization with a well-expressed amplitude modulation of an increase in the number of slow waves, as well as a disorganization of the rhythm with a decrease in their amplitudes. In addition, during the time of a change in the daily schedule there was a decrease in duration, a poor sense of expression and a rapid extinction of the reaction of assimilation of the external stimuli and also a weakening of the reaction of assimilation of the rhythms of light flickerings.

This paper gives data from a study of the biopotentials of the large hemispheres of the brain during a 72-hour period of wakefulness of subjects during confinement to an isolation chamber. The cerebral biopotentials were registered at 0600, 1000, 1400, 1800 and 2200 hours Moscow time.

The subjects were investigated in a darkened chamber while their eyes were closed. Cerebral electric activity was registered using a pen-recording

Abstract: The ecology of arboviruses permits a combined source of infection. Simultaneous infection with Japanese encephalitis and other group A and B arboviruses were observed. Features in the growth of experimental mixed infections were studied for group A (Sindbis + Geta, group B (West Nile + Japanese encephalitis), and group A + B (West Nile + Sindbis). Several different immunological phenotypes were observed and characterized. The interaction of the individual virus type in a mixture may be related to its phenotype. Differences were observed in the experimental A + B mixtures.

SOME EFFECTS DURING THE PASSAGE OF RADIO WAVES THROUGH THE REGION OF AN EXPLOSION

Article by V. A. Vel'min, V. F. Korets, Yu. A. Medvedev and B. M. Litmanov. Moscow, Zhurnal Prikladnoy Mekhaniki i Tekhnicheskoy Fiziki, Russia, No. 2, 1971, pp 136-139

In this article we describe and interpret certain nonstationary effects observed in the passage of radio waves through the region of an explosion.

This interaction between radio waves and the region of an explosion is of interest in connection with the fact that study of such interaction may yield data on the processes within the explosion which could be obtained in no other way. The electromagnetic probe method possesses an unquestioned advantage over other methods (such as the simple probe method) in that, being essentially active, it does not exert a disturbing influence during the measurements (weak field).

In Figure 1, devoted to the interaction of radio waves of the centimeter range with the region of an explosion, it is shown that the specific shock wave is opaque, provided its velocity exceeds 2.4 km/sec. With any decrease in velocity, however, the shock wave becomes increasingly transparent. After a time, evidently, products of the explosion absorb their parent, and the interaction of the waves with the explosion region becomes more complicated: apart from purely diffraction effects, such as appear so long as the shock wave remains ideally conductive, there arise in direct passage of the radio beams through the products of the explosion, and this in turn raises the question of the relative role of such effects in the mechanism of the interaction of radio waves and explosion products. If the explosion happens to be irradiated exclusively through the lateral section of the beam, and if at the point of the explosion a small number of terminal Fresnel spots exists, then enlargement in the region of the explosion will result in absolute superimposing of the Fresnel zones, which will lead to oscillation of the energy flow at the point of receiver. The oscillation period being determined by the speed of overlapping of

"Inoculation of Soybeans With Peronospora"

Leningrad, Mikologiya i Fitopatologiya, No 4, 1971, pp 395-398

Abstract: The possibility of infecting soybeans with Peronospora in various developmental phases, from swelling of the seeds to formation of the beans, was determined. An inoculum from conidia and oospores was applied to seeds, leaves, and roots. During the period of seed swelling and germination, diffuse infection was effected both by conidia and oospores. The nature of the infection was determined by the age and physiological condition of the plants (intensity decreased with age). When shoots of the cotyledons were infected as they emerged on the soil surface, most of the plants were diffusely infected. Thereafter infection was only local. Mature plants could be infected only through the leaves. The number of diseased plants and the intensity of injury increased the longer drops of the inoculum remained in contact with the leaves.

A MIXED FORM OF RECKLINGHAUSEN'S DISEASE

L. M. Korganova

The author describes a rare case of a mixed form of Recklinghausen's disease, which was encountered in the pathomorphological department of a general hospital in Rostov/Don. This case was the first during 25 years on a material of 17 000 post-mortems. Brief literary data on the pathogenesis of the disease and its form are given in the report. The neurofibromas found in the morphological studies of the author were located in the left cerebellar hemisphere, in the lungs and subcutaneous cellular tissue of the lumbar region. In a detailed histological study of the neurofibromas special attention was attracted to an unusual structure of the tumorous nodes in the lungs with peculiar glandular-like passages in the node tissue. This again confirms the assumption that the neurinomas in Recklinghausen's disease should be attributed to the hamartoma type.

"Device for Measuring the Induction of Constant Magnetic Fields"

Moscow, Izmeritel'naya Tekhnika, No 6, 1972, pp 51-52

Abstract: A uniquely designed, self-compensating device for measuring the induction of constant magnetic fields, operating on the basis of a commercially available Hall generator, has been developed by the authors at the "Information Measurement Engineering" department of the Kuybyshev Polytechnical Institute. This device does not possess the drawbacks of the devices conventionally used for this purpose, such as manual balancing and thermal stabilization of the Hall generator, and a value of the electrical output signal which is insufficient for automatic signal measurement and recording.

The specifications are: measurement limits - 0.001, 0.01, 0.1 T; basic error, not taking into account the error of the output instrument, about 1%; nominal output current - 3 mA; pass band - 1 Hz; supply voltage 220V  $\pm$  10%, 50 Hz. The device is made from series-produced, domestically manufactured subassemblies and parts, and is suitable for extensive application in various branches of the electrical engineering industry, as well as for development.

"Study of the Intensity Fluctuations of the Induced Emission of a Gas Laser in Low and Infralow Frequency Ranges"

Moscow, Radiotekhnika i elektronika, Vol XVII, No 2, 1972, pp 425-426

Abstract: Results are presented from experimental studies of the intensity fluctuations of the induced emission of a gas laser in the 0.1-10 hertz range. Distribution curves were calculated from the results on a digital computer, and good agreement was detected with normal gaussian distribution. A curve is presented corresponding to a gas discharge tube current of 14 milliamps and another for 9 milliamps. The magnitude of the intensity fluctuations of the induced laser radiation increased as the frequency dropped, and at  $f = 0.1$  hertz it reached  $\sim 2 \cdot 10^{-3}$  of the mean value of the radiation intensity of the laser. The measurements were performed in a broad frequency band. An expression is presented for the mean square noise current.

"On the Character and Significance of the Dynamics of the Electrical Activity of the Neocortex and the Hippocampus During the Paradoxical Phase of Sleep"

Leningrad, Fiziologicheskii Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 8, Aug 73, pp 1168-1175

Abstract: The dynamics of the electrical activity of various regions of the neocortex and hippocampus were studied in cats during the paradoxical phase of sleep, using spectral analysis and integration of the EEG, ECG and electrical activity of optical and jugular muscles. Changes in the electroencephalogram, electrohippogram, and somatic and vegetative patterns are said to imply a division of paradoxical sleep into two stages. The first stage is characterized by desynchronization of neocortical activity, occurrence of pontogenicule-occipital spikes in the visual cortex and some association and projection areas, abrupt augmentation of hippocampal theta activity with depression of other slow waves, and somatic and vegetative signs of emotional stress.

1/2

- 52 -

ONTANI, T. N., et al., Fiziologicheskii Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 8, Aug 73, pp 1168-1175

In the second stage the hippocampal theta rhythm is depressed simultaneously with either a suppression of slow waves or an increase in the delta rhythm. Neocortical synchronization of slow waves develops, as shown by the predominance of alpha activity and concomitant reduction of stress signs. These findings are said to suggest that the reciprocally interrelated midbrain and mesencephalic structures must be responsible for the regulation of the two stages of paradoxical sleep. In addition the first stage is considered to correlate with emotional tension, and the second stage with its relief.

"Electroencephalographic and Vegetative Correlates of Emotional Reactions"

Leningrad, Fiziologicheskii Zhurnal SSSR imeni I. M. Sechenova, Vol 58, No 7, 1972, pp 1,040-1,049

Abstract: Changes occurring in the electroneocorticogram, electrohippocampogram, and heart rate during the development of various motivational-emotional reactions were investigated in cats with chronically implanted stereotaxic electrodes. Emotional reactions were evoked by electrical stimulation of the reticular formation, central gray matter, and hypothalamus. Intensification of the hippocampal theta rhythm with either an increase or a decrease in heart rate was the most characteristic electroencephalographic correlate of feeding, drinking, and defensive emotional reactions. On the other hand, electrical stimulation of the hypothalamus (ventromedial nucleus and the anterior region) inducing inhibition of natural behavior, including spontaneous feeding and drinking, resulted in inhibition of the hippocampal theta rhythm.

FLUORESCENT CYTOLYTIC STUDIES IN THE DIAGNOSIS OF CHRONIC PROSTATITIS

G. G. Kovalev

Summary

Fluorescent microscopy of the prostate gland has an advantage over routine microscopy of crude and stained preparations of the secretion: along with other composites of the secretion this method enables to judge the state of the epithelial cells. This gives a better understanding of the inflammatory process in the gland. The method shows that increased leukocyte count and reduction of the number of lipid granules is not a sufficient evidence for making the diagnosis of prostatitis, without changes of epithelial cells characteristic of inflammation. Fluorescent microscopy can serve for determination of the course of chronic prostatitis, and of the time for suspension of its treatment. Being simple and accessible, this method may be recommended for wide practical use in urology.

THE FOLLOWING CHANGES OCCUR AFTER THE OPERATION OF EXCISION OR EVERSION OF THE TUNICA OF THE TESTICLE: SCARS, CIRCULATORY DISTURBANCES, DEGENERATION OF THE PARENCHYMA OF THE TESTIS WITH REDUCTION OF ITS FUNCTION. TO AVOID THESE COMPLICATIONS IN COMMUNICATING HYDROCELE AN OPERATION WAS CARRIED OUT WITH PRESERVATION OF THE TUNICA VAGINALIS PROPRIA IN 200 PATIENTS. PROCESSUS VAGINALIS WAS CROSS SECTIONED; THE DISTAL END WAS EXPOSED UP TO THE TESTES, THEN CUT, THE FLUID WAS REMOVED AND THE OPENING IN THE TUNICAE WAS CLOSED BY CATGUT SUTURES. THERE WAS NO RECURRENCE OF HYDROCELE FOR 2 OBSERVATION YEARS. IN OPERATIONS FOR CRYPTORCHISM IN 88 PATIENTS THE TESTICLE WAS BROUGHT DOWN INTO THE SCROTUM WITH THE TUNICA VAGINALIS PROPRIA. FAVORABLE RESULTS WERE OBTAINED IN ALL THE CASES; THERE WAS NO HYDROCELE AND THE TESTICLE IN THE TUNICA SHOWED BETTER DEVELOPMENT.

71-9. USE OF ZONE EQUIVATION FOR ALLOYING THE SEMICONDUCTOR  $In_2Te_3$

Article by L. P. Gal' Yamchikov, A. I. Karin, Elm'yan' Novosibirsk, III  
Department for Protection of the USSR Ministry of Defense, Institute for  
Russian, 12-17 June, 1972, p 811

The method of zone equilibration was used to alloy the semiconductor  $In_2Te_3$   
with copper. The peculiarities of the structure and certain physical parameters  
of the alloyed specimens were investigated for different equilibration conditions.  
The optimal conditions were found which make it possible to obtain uniform  
single-phase specimens of  $In_2Te_3$  alloyed with copper in the concentration range  
of 1-9 atomic percent.

The data obtained indicate that the zone equilibration is an effective  
method of alloying semiconductors of the type of  $In_2Te_3$ .

"Kinetics of Changes in Endogenous SH-Groups in Primary Processes of Radiation Damage"

Moscow, Meditsinskaya Radiologiya, Vol 17, No 7, Jul 72, pp 29-32

Abstract : By using a specially designed semi-automatic set-up, changes in the content of endogenous SH-groups in a rat spleen homogenate were determined directly during irradiation of the latter with gamma-rays. The homogenate was prepared in an Ar atmosphere. The concentration of SH-groups was determined by automatic titration. Irradiation was accompanied by a decrease in the level of SH-groups, which reached its lowest point (corresponding to a decrease by 20%) upon absorption of a dose of approximately 500 rad. Further increases in the absorbed dose up to 2500 rad did not produce any significant additional changes in the SH-group level. No more than 20% of the SH-groups were converted, because simultaneous reduction of the disulfide groups that formed took place. After irradiation had been stopped, intensive regeneration of the SH-groups occurred, with the initial level being restored in 20 min. The phenomena in question, although observed in experiments with a homogenate consisting of destroyed cells, probably did not differ from those taking place during irradiation in vivo in view of the fact that most

"Grafting of Polydimethylsiloxane Macromolecules Onto Surface of Glass Fiber by Thermal Shock Method"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 43, No 9, Sep 70, pp 2350-2354

Abstract: The article describes results of experiments on the grafting of glass in polydimethylsiloxane by the thermal shock method, i.e., by rapidly cooling specimens of alkali-free glass or glass fiber from temperatures of 300-550 to 25° in a toluene solution of polydimethylsiloxane. The hydrophobization of the glass and glass fiber is due to chemical grafting of macromolecules of the organosilicon polymer onto the surface of the glass. The organosilicon film obtained in this way on the glass fiber surface is resistant to thermooxidative degradation up to 450° and endows the glass fiber with high dielectric properties.

"Application Characteristics of High-Melting Compounds for Arc Welding"

Kiev, Avtomaticheskaya Svarka, No 2, 1973, pp 1-4

Abstract: An all-weld metal produced by electrodes GK-15 (85%  $Cr_3C_2$  and 15% Ni), GK-30 (70%  $Cr_3C_2$  and 30% Ni) with metalloceramic core and EO wire consisting of 60%  $Cr_3C_2$  powder enclosed in a nickel shell was studied in the perpendicular and horizontal cross-sections. The obtained results were compared with the metalloceramic alloys KKhN-15, KKhN-30, KKhN-40, and KKhN-50 containing from 50 to 85%  $Cr_3C_2$  and 15-50% Ni. The microstructure of the all-weld metal consisted of the primary carbides and eutectic carbides. The ditrigonal shape of the primary carbides distorted by various growth defects was characteristic for  $Cr_3C_2$  and  $Cr_7C_3$  carbides. The total concentration of carbides was close to that in the electrodes. The ratio between volumes of the solid solution and eutectic carbides always remained at 5 : 1. Sizes and shape of carbide grains in the parallel and perpendicular cross-sections differed considerably. The columnar structure was characteristic for the

1/3

USSR

YUZVENKO, YU. A., et al, Avtomaticheskaya Svarka, No 2, 1973, pp 1-4

parallel cross-sections, and disoriented for the perpendicular cross-sections. The size of the carbide phase and the total structure of the all-weld metal differed from that of metalloceramic alloys. Sizes of the primary carbides in the weld metal were by one order larger than in the alloys. When BO wire was used for welding of steel the built-up metal contained a noticeable amount of  $Cr_7C_3$  carbide in addition to  $Cr_2C_2$ , which was alloyed with iron and nickel. In some cases up to 50% of the electrode carbide was transformed into  $Cr_7C_3$  carbide, with 15-20% Fe and some amount of free carbon. When high-melting compounds (borides, carbides, silicides, and others) are introduced into the molten bath they undergo dissolution, either partial or complete, in the alloy matrix which becomes alloyed with boron, chromium, carbon, and silicon. This could lead to brittleness of the obtained alloy and appearance of cracks. The wear-resistance of the weld metal was much lower compared with the metalloceramic alloys. In order to eliminate the undesirable characteristics of the weld metal produced by the above electrodes, it is recommended to use induction and electroslag welding with a comparatively low linear welding energy, as well as to use liquid addition and penetrating agents. In the case of arc welding

2/3

- 79 -

YUZVENKO, YU. A., et al, Avtomaticheskaya Svarka, No 2, 1973, pp 1-4

the high-melting metal should be supplied as an addition agent (powders, rods, mixtures) at the end of the molten bath. The use of high-melting compounds in electrodes is undesirable.

"Effect of Technological Factors on the Durability of Sulfidized Iron-  
Graphite"

Kiev, Poroshkovaya metallurgiya, No 3, 1972, pp 99-105

Abstract: The strength properties of cermet materials after sintering are governed not only by the composition of the mixture but by a variety of technological factors as well. Varying the alloying efficiency of iron particles with carbon will almost double the strength of sulfidized iron-graphite; raising the dispersity of the starting powders four-fold may increase the material's strength by 30%; reducing the porosity from 30 to 1% will increase the strength characteristics of the material four to five times. Addition of zinc sulfide to alloy the particle contacts with zinc will raise the integral hardness by almost 30%. It has been established that the mechanism of strengthening cermet materials during plastic deformation is determined primarily by the material's initial porosity. "Processes Occurring During Sintering of Iron-Graphite Containing Zinc  
Sulfide"

Kiev, Poroshkovaya Metallurgiya, No 1 (97), Jan 71, pp 18-22

Abstract: A study was made of the behavior of zinc sulfide -- one of the basic components introduced into iron-graphite cermets materials to improve their antifriction properties. The paper includes a study of the effect of porosity on the variation in chemical composition of  $ZnGr3Ts4$  materials during sintering. The effect of temperature, isothermal holding time, moisture of the protective environment, and its composition (argon, hydrogen) on the intensity of weight loss of the zinc sulfide placed in the heating zone in powdered form was also studied.

It was found that during heating in hydrogen, zinc sulfide can partially decompose. With an increase in the hydrogen temperature and humidity the decomposition intensity increases. During sintering of  $ZnGr3Ts4$  in  
1/2

USSR

KORKH, L. M., et al, Poroshkovaya Metallurgiya, No 1 (97), Jan 71, pp 18-22

hydrogen, the decomposition products of the zinc sulfide interact with the surface of the iron particles to form iron sulfide and their solid solution in zinc sulfide. At a sintering temperature above 975°C, a liquid phase is formed in the material -- a sulfide-carbide eutectic enveloping the surface of the iron particles -- which during sintering under pressure gives the material its fibrous structure. With a decrease in porosity, the content of sulfur and zinc in the sintered ZnGr3Tss4 material increases. Thus, the nonporous material contains twice as much sulfur and six times more zinc than the material with a porosity of 20 percent.

"Generation of Hard Quanta in Electrical Undulators"

Yerevan, Izvestiya Akadmir Nauk, Armyanskoy SSR, Vol 5, No 6,  
1970, pp 418-424

Abstract: The problem of the radiation of particles traveling at speeds approaching that of light in a transverse sinusoidal electric field is considered. The assumption is made that the energy of the particles is constant. A formula is obtained for the  $n$ -th harmonic of the radiation which shows that the lower frequency limit is independent of the energy, whereas the upper limit is proportional to the square of the energy. Integrating the expressions for each harmonic between these limits, the author obtains an expression for the full energy radiation per unit path of particle travel. For his numerical calculations, he used the electron computers Razdan-3 and Razdan-2. He also obtains an expression for

1/2

USSR

KORKHMAZYAN, N. A., *Izvestiya Akadmiir Nauk, Armyanskoy SSR*,  
Vol 5, No 6, 1970, pp 418-424

the full quantum number per unit path of particle travel, a number independent of the particle energy for each harmonic as well as for the whole radiation. For heavy particles, the number of quanta drops substantially, and magnetic instead of electric undulators can then be used. The author is connected with the Yerevan State University.

Aluminum Atoms in the System of Binary Nickel-Aluminum Alloys"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 31, No 3,  
Mar 71, pp 634-637

Abstract: Single-phase alloys of nickel with 25, 50, 60, and 75 at. % Al were studied. The emission K spectra of nickel and aluminum were studied and compared with the L spectra presented in the literature. The data produced indicated that the formation of aluminides in the nickel-aluminum system involves a significant redistribution of electrons between the atoms of aluminum and nickel. In contrast to aluminides of the first half of the period, nickel aluminides apparently include both covalent bonds and ionic bonds, the share of ionic bonds being quite high in comparison with the iron-aluminum and cobalt-aluminum systems studied earlier. The change in the form of the Al K $\beta$  x band in the nickel-aluminum system indicated that, in contrast to the

KORKONOSOV, V.P., and PERESYPKIN, A.V."Stability of Radioisotopic Relay-Type Instruments"

V sb. Tochnost' radioelektron. apparatury (Accuracy of Electronic Equipment -- Collection of Works), Sb. 1, Moscow, 1971, pp 167-168 (from RZh-Avtomatika Telemekhanika i Vychislitel'naya Tekhnika, No 1, Jan 72, Abstract No IA576 by B.U.)

Translation: In the operation of radioisotopic relay-type instruments (RRI) the stability of their parameters during variations in the ambient temperature and supply voltage is of particular importance. Since the radioactive radiation sources used in RRI do not depend on these factors, the principal cause of RRI instability is the instability of the detection unit and electronic relay unit. The instability of the detection unit is determined entirely by the instability of the radiation detector that is used. Current RRI most often use scintillation gas-discharge counters as the radiation detector. The instability of detection units (DU) with scintillation counters reaches 20%, while with gas-discharge counters it reaches 10%. The instability of the relay unit depends on the method of processing the statistical information coming from the DU. The use of the discrete information processing method as the basis of relay unit construction is promising from the standpoint of increasing

1/2

USSR

KORKONOSOV, V. P., et al, Technost' radioelektron. apparatury, Sb. 1, Moscow 1971, pp 167-168

RRI stability. A description is given of a relay unit which is based on the discrete information processing method. The instability of its thresholds does not exceed 10% over the entire temperature variation range and does not exceed 1% for supply voltage variations in the range of minus 15% to plus 10% of the rated voltage.

"Corrosion of Copper-Nickel Sea-Water Pipes"

Moscow, Zashchita Metallov, Vo. 6, no. 4, Jul-Aug 70, pp 429-433

Abstract: A study was made of corrosion distribution over standard elements of copper nickel pipes: branch pipes, elbows, flange couplings, pipes with a pinch (0.1 of the inner diameter of the pipe). The test duration was 6000 hours and the sea-water flow rate was 3, 5, and 7 m/sec. The branch pipe appeared to be subjected to most intensive pitting corrosion. The pits were cavity shaped with maximum depth near the weld. The weld itself showed no appreciable corrosion. A similar picture of corrosion failures was observed at pipe joints tested at current flow rates of 3 and 5 m/sec. The maximum cavity depth in 6000 hours of testing at a flow rate of 7 m/sec was 1.64--2.85 mm and at 3 and 5 m/sec -- 0.25 to 0.64 and 1.24 to 1.48 mm, respectively. Elbows with a bend radius of 2 outer diameters showed pitting corrosion at the area of the bend; the cavity depth was 3.4 mm. Pitting corrosion areas were observed near local obstacles, such as pinches, projecting weld joints, etc.

"Photovoltaic Effect of Ice"

Tomsk, Izvestiya Vysshikh Uchebnykh Zavedeniy -- Fizika, No 5, 1972, pp 151-152

Abstract: The article describes some results of a study of the photovoltaic effect of ice. The same measuring procedure was used as in studies of the Becquerel effect and mechanovoltaic effect in water. Measuring electrodes were frozen into an electrolyte in a refrigerating unit at  $-8^{\circ}$  C. The base between measuring electrodes was 3 cm, illumination 500 lx. The parabolic interpolation method was used to analyze the results, with calculations limited to a first-order parabolic equation with determination of root-mean-square deviation. V. KHOTIMSKIY's tables were used to facilitate the calculations, which were performed on a Promin'-2 computer. As in the case of the photovoltaic effect in aqueous solutions, the character of variations in the potential difference between the measuring electrodes depends on the character of the treatment of the latter, how long they are in air and in the electrolyte, and the duration and intensity of preillumination.

"Reaction of Phosphorus Pentachloride With Alkadienes"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 10, Oct 73, pp 2157-2159

Abstract: The reaction of phosphorus pentachloride with 2,4-hexadiene was investigated. The addition products of phosphorus pentachloride with butadiene, isoprene, and 2,4-hexadiene were decomposed with a solution of white phosphorus in phosphorus trichloride yielding 4-chloro-2-alkenyldichlorophosphines. These products were reacted with alcohols and mercaptans in presence of triethylamine to yield dialkoxy (dialkyldithio) 4-chloro-2-alkenylphosphonites.

"Reaction of Di( $\beta$ -chloroethyl) Vinylphosphonate With Trialkylsilyl-  
alkanethiols"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 12, Dec 73, pp 2786-2787

Abstract: Di( $\beta$ -chloroethyl) vinylphosphonate reacts easily with tri-  
alkylsilylalkanethiols under UV light for 18-20 hrs at 30-35° yielding  
di( $\beta$ -chloroethyl)  $\beta$ -(trialkylsilylalkylthio)ethylphosphonates, as a  
result of an anti-Markovnikov's addition.

"A Method of Synthesizing Dialkyl (Monothiodialkyl) Esters of  $\beta$ -Methyl- $\gamma$ -chloropropenylphosphonic Acid"

USSR Author's Certificate No 308013, filed 27 Dec 68, published 7 Sep 71  
(from RZh-Khimiya, No 15, Aug 72, Abstract No 15N495P)

Translation: Compounds of the general formula  $RO(RX)P(O)CH=C(Me)CH_2Cl$  (I) (R = alkyl, X=O, S) with insecticidal activity and low toxicity for warm-blooded animals are synthesized by reacting  $\beta$ -methyl- $\gamma$ -chloropropenylphosphonic (thiophosphonic) acid chlorides with alcohols in the presence of tertiary amines. Nineteen and eight tenths grams of  $Cl_2P(O)CH=C(Me)CH_2Cl$  is added with cooling to 7.9 grams of absolute ethanol, 13.6 grams of pyridine and 75 ml of absolute ether. The liberated pyridine hydrochloride is filtered, the filtrate is vacuum distilled, and 11.8 grams of I is isolated (R = Et, X = O), yield 55%, melting point 129-31<sup>o</sup>/3,  $n_D^{20}$  1.4622,  $d_4^{20}$  1.1954. Other compounds of general formula I are obtained analogously (given are R, X, yield in %, melting point in <sup>o</sup>C/mm,  $n_D^{20}$  and  $d_4^{20}$ ): n-Pr, O, 46.5, 140-1/4, 1.4611, 1.1289; n-Bu, O, 43.9, 140-2/1.0, 1.4629, 1.0706; Et, S, 40.0, 114-6/0.5, 1.5103, 1.2461; n-Pr, S, 41.2, 124-6/0.5, 1.5180, 1.1917; n-Bu, S, 39.8, 136-7/0.3, 1.5129, 1.1901; n-C<sub>6</sub>H<sub>11</sub>, S, 4.12, 157-9/0.5, 1.4995, 1.0949.

"Reaction of Phosphorus Pentachloride With Metallyl Chloride"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70,  
pp 1989-1992

**Abstract:** Phosphorus pentachloride reacts in the cold with metallyl chloride forming a complex, which on treatment with SO<sub>2</sub> or H<sub>2</sub>S converts to dichloroanhydrides of  $\beta$ -methyl- $\gamma$ -chloropropenylphosphonic (I) or thiophosphonic acids. Chlorination of (I) gives a dichloroanhydride of  $\beta$ -methyl- $\alpha, \gamma$ -dichloropropenylphosphonic acid. The preceding reactions give several esters of  $\beta$ -methyl- $\gamma$ -chloropropenylphosphonic and thiophosphonic acids, the physical properties of which are tabulated. Dialkyl ethers and the dichloroanhydride of (I) react with sodium alkoxide forming dialkyl esters of  $\beta$ -methyl- $\gamma$ -alkoxypropenylphosphonic acids. Reacting the dialkyl esters of (I) with diethylamine give dialkyl esters of  $\beta$ -methyl- $\gamma$ -diethylamino-propenylphosphonic acid.

"Reaction of Phosphorus Pentachloride With Ethylmethallyl Ether"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 6, Aug 70,  
pp 1711-1713

Abstract: Reaction of phosphorus pentachloride with ethylmethallyl ether in benzene at 0 - -5° gives a complex which may be decomposed with SO<sub>2</sub> to yield a dichloroanhydride of β-methyl-γ-chloro-γ-ethoxypropenylphosphonic acid (I), b.p. 115-117°/2mm,  $d_4^{20}$  1.3117,  $n_D^{20}$  1.4862. When (I) is reacted with sodium alkoxides, dialkoxyphosphone-β-methylethylalkylacryl acetals are obtained. Heating these acetals for 50 hours at 100° with isoprene, an equimolar amount of water, traces of hydrochloric acid, and hydroquinone does not yield any products of the expected diene synthesis, only β-dialkoxyphosphane-α-methylacroleins. Reaction of the latter products with 2,4-dinitrophenylhydrazine gives the corresponding 1/1 hydrazones.

"On the Evaluation of the Efficacy of Antitumor Chemotherapy by Patient Survival"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 4, 1971, pp 596-606

Abstract: The paper examines the quantitative evaluation of the efficacy of patient treatment on the basis of the supposition that the survival of a patient is determined by the formula  $t_m = \tau \gamma$ , where  $t_m$  is the duration of life from the beginning of therapy until death,  $\tau$  is the time when the tumor is doubled, and  $\gamma$  is the tumor's growth factor which depends on the size of the tumor at the beginning of therapy and at the time of death. It is assumed that effective therapy prolongs life by destroying part of the tumor cells. Two plans of treatment were considered. With a one-time therapy course the following quantitative parameters were determined: number of patients sensitive to the preparation; number of patients cured as a result of its use; number of patients whose life was prolonged as a result, and the extent of such

1/2

USSR:

KORMAN, D. B., et al., Izvestiya Akademii Nauk SSSR, Seriya Biologicheskaya, No 4, 1971, pp 596-606

prolongation; and the average decrease in size of the tumor from the effect of the therapy. The second plan of treatment (therapy continuous up to time of death) makes it possible by comparing the survival of treated and control patients to determine the proportion of tumor cells destroyed by the preparation at any instant and to establish the time of onset of resistance to the preparation. Investigation by comparison consists of several stages: 1) forming a test group and control group of patients, selected with a similar extent of the process; 2) determination of a reliable difference in the survival in these groups; 3) determination of quantitative characteristics of the direct effect of the preparation on the tumor. Survival of a group of patients is characterized by three parameters: number of cured patients, mean logarithm of period of survival, and standard deviation of the log-normal distribution of such period. There are as yet not enough data on survival of patients treated with chemotherapy, but its widespread use should soon yield the necessary data for evaluation of its effectiveness.

103961e Physicochemical properties of 1,4-tetra- and 1,8-octamethylene diisocyanates. Zhuravlev, E. Z.; Voronina, T. L.; Fereslegina, L. S.; Kormushechikina, A. I.; Konstantinov, I. I. (Inst. Appl. Chem. Acad. Sci. Dzerzhinsk, USSR). Zh. Prikl. Khim. (Leningrad) 1970, 43(1), 169-63 (Russ). From temp. dependence of mol. vols. in  $(CH_2)_n(NCO)_2$  with  $n = 4$  or 8, as well as from temp. dependence of their d., viscosity and  $\eta$ , it was concluded that the contribution of methylene groups to mol. vols. depends not only on the temp. but also on their location in the mol. Activation energy of flow is increased by 120 cal/mole per  $CH_2$  in the 20-50° interval and by 90 in the 50-80° interval. The NCO group contribution is 2700 cal/mole and 2350 cal/mole, resp. Thus, these isocyanates have a degree of interaction or conjugation not only within NCO groups but also between the terminal NCO groups, which declines with increasing value of  $n$ . G. M. Kosolapoff

AN ATTACHMENT FOR LASER MICROIRRADIATION FOR THE BIOLOGICAL MICROSCOPE

[Article by M. Ya. Korn, Institute of Epidemiology and Microbiology named N. P. Gamaleya of the USSR Academy of Medical Sciences, Moscow, Moscow, Bulletin Eksperimental'noy Biologii i Meditsiny, Russian, No 10, 1971, submitted 27 November, 1970, presented by G. V. Vygodchikov, Academician of the USSR Academy of Medical Sciences, pp 117-118]

An attachment was designed for the biological microscope which makes it possible to transform the microscope into a device for laser microirradiation. The attachment was built on the principle of the domestically produced luminescent illuminator G1-17 by replacing the interference color-selective plate with an analogous plate having other characteristics, and by having an additional sliding eyepiece. The attachment is easily mounted on any biological microscope and makes it possible, together with microirradiation, to conduct observation and microphotography at any microphoto setting. (Bull. exper. biol., 1971, No 10, p 117)

Microirradiation has been widely used in recent years for its effect on treated cells and cell structures [1, 2]. Comparatively simple devices of special laser microscopes are usually adapted for this purpose [3, 4]. In some studies, one of the eyepieces of a tri-ocular microscope was used for laser microirradiation, and the two others, for observation and for microphotography [5].

The attachment, which makes it possible for any biological microscope to be easily transformed into a device for microirradiation was built on the principle of the domestically produced luminescent epa-illuminate G1-17 by a comparatively simple alteration. This alteration consists of replacing the interference color-selective plate, designed to reflect the light-actuating luminescence on an object, with an analogous plate which selectively reflects the spectral region of laser radiation

"Photoelectric Method for Control of Rectilinearity"

Moscow, Izmeritel'naya Tekhnika (Measurement Technology), No 1, 1970, pp 30-31

Translation: The article substantiates a photoelectric method for control of rectilinearity using a system of rectangular mirrors and position-sensitive photo-detectors. It was shown that the proposed method enables continuous space and time control of profile rectilinearity of an object directly in linear units. A description is given of an experimental unit in which the energy axis of a laser is used as a straight line specimen. The experimental results of investigation of the unit are presented. "A New Standard for the Method of Resolvometric Testing, and Modern Projection Resolvometers"

Leningrad, Issledovaniya v Oblasti Opticheskikh i Svetovykh Izmereniy, Trudy Metrologicheskikh Institutov SSSR, No 114(174), 1970, pp 96-103

Abstract: The article reviews the new State Standard GOST 2819-68 for the method of resolvometric testing of black-and-white and color photographic materials on a transparent base with a resolution of up to 1200 lines/mm. Resolvometric tests of photographic materials with resolutions up to 600 lines/mm should be done with a type OS-16 microscope objective with a number aperture of 0.3. Projection resolvometers type SR-17 and RP-2 are recommended for this resolution range. For testing high-resolution materials, a type OS-8 microscope objective should be used with a number aperture of 0.65 and a type RP-2M resolvometer. The types of presently used resolvometers and the RP-2M resolvometer are described, and the characteristics of the Ascheulov test transparencies used in the resolvometers are given. "Calculation of Optimal Parameters of Thermal Distillation Equipment for  
Salt Water With Maximum Evaporation"

Moscow, Vodosnabzheniye i Sanitarnaya Tekhnika, No 6, 1971, pp 4-8

Abstract: The basic problem facing design of novel desalination equipment is the selection of optimal parameters assuring production of fresh water at minimal cost. A method is reported for determination of such optimal parameters for multiple stage desalination units with maximum evaporation in which the concentration of the solution is brought to about the crystallization point of various salts. To prevent accumulation of sediment on heating surfaces hydrophobic heat carrier is used. An apparatus consisting of the main heater, heat exchange chamber, evaporation chamber, condenser and a pump, and the principles of operation are described in detail. Formulas have been developed, which were solved using the ETRVM "Minsk-22" system. Optimal parameters for desalination equipment have been reported graphically.

"Optimal Parameters of Thermal Desalination Plants"

Moscow, Vodostabzheniye i Sanitarnaya Tekhnika, No 8, 1970, pp 1-4

Abstract: Since desalination plants based on the distillation principle are still the most economical (in fact, the only) means of removing salt from large amounts of water, selection of their parameters represents a critical problem. As a guide for this purpose, the authors combine a number of physical (purpose of plant, temperature, use of adaptive evaporation or sudden boiling) and economic factors, to arrive at formulas for selecting optimal parameters. The paper is accompanied by full derivations and a sample calculation.

"Sorption of Fluoride Ion on Anionite EDE-10F in the Hydroxyl Form"

Kiev, Ukrainskiy Khimicheskij Zhurnal, Vol 38, No 11, 1972, pp 1172-1174

Abstract: The sorption of fluorine from solutions of NaF and HF by the anionite EDE-10F in the hydroxyl form was studied. Resin in the hydroxyl form, air dried, was loaded into a polyethylene column, and sorption was accomplished by passing solutions of NaF and HF at varying rates of filtration. The anionite was then washed, first with distilled water and then with solutions of either NaOH or KOH. The degree of charging of the ionite during sorption from acidic solutions is significantly higher than that from weakly alkaline solutions (NaF). During the washing of the resin with water there appears a quantity of fluorine which cannot completely be attributed to the hydrolysis of the resin. This is brought about by molecular sorption or desorption from the sorbed material. The first filtrate fractions during elution with alkali have an acidic reaction, which points to desorption into solution of an acidic difluoride ion, which in the process of sorption is taken up by the resin. This is 1/2

USSR

KORNELLI, M. E., et al., Ukrainskiy Khimicheskiy Zhurnal, Vol 38, no 11, 1972, pp 1172-1174

supported by the bimodality of the elution curve during desorption with alkali, suggesting the presence in the ionite phase of 2 types of ions ( $F^-$  and  $HF_2^-$ ).

By selecting the type of eluent and its concentration in solution during desorption of the fluoride ion from EDE-10pi resin, one can obtain concentrated solutions of metal fluorides. Thus EDE-10P can be used for concentration of fluoride ions in analytical and applied chemistry.

"Glucocorticoid Function of the Adrenals in Cases of Food Poisoning"

Moscow, Sovetskaya Meditsina, No 5, 1972, pp 69-71

Abstract: In spite of the fact that symptoms of adrenal insufficiency have been noted in cases of food poisoning and therapists use glucocorticoids in treatment, glucocorticoid function with this disease has been little studied. A group of 113 food poisoning cases were tested for 17-hydroxycorticosteroids (17-HCS) in urine. The cases were of diverse etiology (Staphylococcus, Salmonella and others) with a typical clinical syndrome of food poisoning: acute gastroenteritis and circulatory disorders. A significant decrease in excretion of 17-corticosteroid paralleled the severity of the disease. Even with steroid therapy, excretion of 17-HCS was still significantly less than normal. After ACTH injections, however, the excretion of 17-HCS increased more in the ill persons than in healthy persons, comparing their initial levels of excretion. The low level of 17-HCS may be explained by a complex hormonal situation: a sharply increased tissue demand for glucocorticoids

"Tyleron as an Interferon Inductor"

Moscow, Antibiotiki, Vol 18, No 6, Jun 73, pp 517-520

Abstract: In the current investigation the harmlessness, interferonogenic activity, and protective action (against infectious viral diseases) of tyleron hydrochloride were tested by administering the drug to white mice hypodermically and orally and to monkeys orally. It was established that there is no toxic effect from various dosages of tyleron hydrochloride with either method of introduction. A marked interferonogenic action was obtained where tyleron hydrochloride was given to mice in dosages of 5, 10, and 20 mg/kg and where 25 mg/kg were administered to monkeys. Oral administration proved more beneficial, while no difference was found between a dosage given in one part daily and given in three equal parts daily. Combining tyleron and prodigiozan made it possible to cut the dosage of 1/2

USSR

YERMOL'YEVA, Z. V., et al., Antibiotiki, Vol 18, No 6, Jun 73, pp 517-520

tyleron in half and increased the titer and length of interferon circulation in the blood by 50%. Tyleron was found to have a marked protective effect for influenza pneumonia in mice, despite low titers of circulating interferon. On the basis of this investigation, tyleron hydrochloride may be recommended as an effective interferon inductor.

111-6. STUDY OF THE INTERFACIAL LAYERS OF GERMANIUM OBTAINED FROM EXPANSION:  
Article by L. N. Kornev, S. A. Tolstov, S. A. Kuznetsov, L. N. Kornev, E. A. Kuznetsov, G. V. Korovin, III Sibirskiy po Protsessam, Kozak i Sibirskaya Poligrafiyevskiy Khabarovskiy, Khabarovsk, Khabarovsk, 12-17 Jan 1971, p 171

1. Layers of germanium were grown by the hydrolysis method in a reactor with high frequency heating and in a metal reactor with direct filament heating on strongly alloyed germanium substrates.

2. The alloyed layers of germanium were grown from a mixture of hydrolyzed germanium with fibrous or phosphorus.

3. The morphology, the structure and the electrical parameters of the germanium layers were investigated as functions of the expansion conditions: the growth temperature, the hydrolysis concentration, the linear flow rate, and the state of the substrate surface.

"Fermentation Reaction Types and Colicinogenic Properties of Shigella Sonnei Circulating in the City of Kishinev, and Determining Their Sensitivity to Antibiotics"

Kishinev, Zdravookhraneniye, No 5, Sep/Oct 71, pp 7-9

Abstract: The Shigella sonnei strain accounted for 97.9-99 percent of the cases of dysentery in Kishinev in 1968-70. The object of this study was to identify the types of fermentation reactions of Shigella sonnei isolated in 1968-70 (4,507 cultures), and to study their colicinogenic properties and sensitivity to antibiotics. Shigella bacilli isolated from victims in 1968 were found to be primarily fermentation type II (71.4 percent); in 1969-70, type I bacilli predominated (66.4-94.1 percent); Shigella type III was most frequently isolated from the healthy. The results of studies on colicin production showed that, of 922 cultures, 842 were inactive with respect to E. coli K-12 and E. coli B and  $\phi$ ; 76 cultures were colicin type K-12; 4, colicin type  $\phi$ .

Among the K-12 type cultures, 54 percent were fermentation type I; 44.3 percent were type II; and 1.2 percent were type III. The cultures isolated in 1969 exhibited a gradual decrease of strains sensitive to levomycetin, and a growing number of strains sensitive to neomycin and monomycin.

"Enzymatic Types of Sonnei Dysentery Pathogens Circulating in Kishinev"

Kishinev, Zdravookhraneniye, No 3, May/June 1970, pp 43-49

Abstract: The number of Sh. Sonnei strains isolated in Kishinev in 1968 was more than four times greater than in 1957. Many healthy individuals are carriers of these bacteria. A total of 1,714 cultures of Shigella Sonnei were investigated to determine their morphological, peptolytic, antigenic, and other properties, including their ability to ferment sugars to acids. Pathogens were classified into three enzymatic types. Type I -- cultures ferment rhamnose within the first 24 hours of incubation at 37°C, but do not ferment xylose for a week; type II -- cultures ferment rhamnose with a delay (after three to four days), or do not ferment either rhamnose or xylose; type III -- cultures ferment both sugars within the first 24 hours. Of the 1,714 cultures investigated, 72.6% belonged to type II, 21.5% to type I, and 7.1% to type III. The tests are fairly easy and can be performed in routine clinical laboratories.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE BENEFITS ACCORDING FROM THE ELECTROCHEMICAL POLISHING OF GEARS ARE NULLIFIED WHEN A CONVENTIONAL FLAT OR ANNULAR CATHODE IS USED, DUE TO APPROXIMATE DOUBLING OF THE TOOTH PROFILE ERROR AS A RESULT OF THE FORMATION OF AN EXCESSIVELY LARGE FLANK. A CATHODE WITH SLITS IS PROPOSED, WHICH PROVIDES FOR INVARIABILITY OF THE TOOTH PROFILE IN POLISHING. A DESCRIPTION OF THE CATHODE IS PRESENTED, AND ITS OPERATION IS DESCRIBED. WHEN GEARS WERE ELECTROCHEMICALLY POLISHED WITH THE USE OF SUCH A CATHODE, WITH A CURRENT DENSITY OF 160 A-DM<sup>2</sup> AND A TEMPERATURE OF 55DEGREES C, A PROFILE WAS OBTAINED, THE ERROR OF WHICH CORRESPONDS ESSENTIALLY TO THE INITIAL GRINDING ERROR OF THE TOOTH PROFILE.

"Investigating the Process of Obtaining Light Powders by the Thermal Breakdown of Carbonyl Nickel"

Moscow, Tsvetnyye Metally, No 8, Aug 70, pp 26-27

Abstract: A study was made of the process of obtaining light powders by the thermal breakdown of carbonyl nickel. The purpose of the investigation was to determine the optimal starting conditions for the equipment and to study the interrelationship of the parameters in the starting and operating periods of the process. The possibility of intensifying the process without additional heating of the pulverizing equipment was also looked into. The operations involved in the investigation were done with equipment consisting of a pulverizer, a vaporizer, and a thermal-exchange device. These were parallel operations, each being carried out on individual sets of this equipment and under the following conditions: the temperature of the heated gas was held constant and the pressure in the equipment kept within

150-170 mm (water column); tests of the powder were taken hourly from each of the systems; with a bulk-weight increase of more than  $0.5 \text{ g/cm}^3$ , the productivity of the equipment was lowered by reducing the vaporizing rate of the carbonyl nickel, as a result of which the temperature of the pulverizer's upper zone increased with a drop in the powder's bulk weight; with a reduction in the bulk weight below  $0.3 \text{ g/cm}^3$ , the same action occurred in reverse order. After completion of the operations, the equipment was opened and the roofs of the four pulverizers were found to be overgrown with deposits of nickel powder to various extents, depending on the operation period, which differed for each system. A photograph of the deposits on the inner roof of one of the pulverizers is shown.
